Mobile Banking - NFR and Security Requirements

1. Purpose

This document contains non-functional and security expectations that complement the feature brief. A feature may be functionally correct but still fail release assurance if these expectations are not validated.

2. Performance

Interactive mobile actions should meet the approved response-time SLO under representative production load. The exact threshold is maintained by platform governance and should be retrieved from the current baseline rather than guessed.

3. Security

- High-risk actions require step-up authentication when the policy condition is met.
- Sensitive events must generate auditable security records.
- Client responses must not disclose internal fraud-rule details.
- Authentication fallback must preserve the same authorization boundary as biometric verification.

4. Availability and Recovery

Critical card-control operations require resilient handling of downstream interruption. A failed downstream dependency should produce a recoverable user outcome and auditable event rather than ambiguous success.

5. Privacy

Logs used for test evidence should avoid unnecessary exposure of card numbers, authentication secrets, or sensitive message contents. Evidence should be sufficient to validate behavior without reproducing restricted data.

6. Observability

Release evidence should make it possible to distinguish functional failure, dependency failure, authorization failure, and client error. This distinction is important when interpreting automated test results.

7. Change Impact

Approved security change CR-901 modifies Card Controls behavior. Existing tests that assume immediate unfreeze after a fraud lock may be stale and should be reviewed. The change also affects user-story acceptance hints and current release evidence.

8. Delivery Assurance Expectation

The application should connect feature intent, NFR/security evidence, regression results, and change requests. A PASS result for a functional test does not prove that security or performance expectations were satisfied.
