1. Change Governance

Northstar Commerce is preparing a multi-release modernization of its digital commerce platform. This specification is intentionally detailed and includes overlapping business, API, testing, and governance content so that delivery-assurance systems must reason across multiple artifacts rather than rely on one isolated paragraph.

A change can invalidate existing acceptance criteria, test cases, automation, API contracts, or release assumptions. Delivery assurance should identify likely impact before implementation reaches final test.

1.1 Operational Guidance

Delivery assurance requires a consistent relationship between business intent, implementation evidence, and release decisioning. A requirement is considered ready for verification only when its scope, preconditions, expected behavior, failure behavior, and measurable acceptance conditions are sufficiently clear. Where the specification leaves material ambiguity, the delivery process should record the uncertainty rather than silently infer a business rule. Traceability must be maintained at a level that allows a reviewer to determine which tests provide evidence for each approved requirement and which release risks remain unresolved. The expected evidence includes source references, stable identifiers, ownership, version status, and execution outcomes so that downstream analysis can distinguish current policy from historical guidance.

Teams should distinguish defects in implementation from defects in the requirement itself; the latter may require product clarification before a test oracle can be defined.

2. Contract Changes

API changes may alter mandatory fields, response codes, idempotency behavior, or security controls. An impact analysis should identify both direct API tests and downstream business-flow tests.

3. Business Rule Changes

A changed eligibility or decision rule may require updates to positive, negative, boundary, and regression tests. Historical test results do not prove compliance with the new rule.

4. Non-Functional Changes

A revised SLO changes the test oracle even if application code is unchanged. Performance evidence should be evaluated against the current approved target.

5. Release Impact Summary

The delivery team should produce a traceable list of affected requirements, tests, defects, and evidence gaps for each approved change.

Change	Affected Areas	Expected Assurance Action
CR-011 new mandatory checkout field	Checkout API, UI, tests	Impact analysis + regenerate/repair affected tests
CR-019 stricter admin step-up	Identity/security	Add negative and authorization tests
CR-027 p95 target tightened	Platform NFR	Update performance oracle and rerun
CR-034 refund rule change	Refunds, payment policy	Review traceability and regression set
