This document was superseded by DOC-01. It remains in the corpus to test current-versus-archived retrieval behavior.

Historical instructions must not override current approved requirements.

1.1 Operational Guidance

Delivery assurance requires a consistent relationship between business intent, implementation evidence, and release decisioning. A requirement is considered ready for verification only when its scope, preconditions, expected behavior, failure behavior, and measurable acceptance conditions are sufficiently clear. Where the specification leaves material ambiguity, the delivery process should record the uncertainty rather than silently infer a business rule. Traceability must be maintained at a level that allows a reviewer to determine which tests provide evidence for each approved requirement and which release risks remain unresolved. The expected evidence includes source references, stable identifiers, ownership, version status, and execution outcomes so that downstream analysis can distinguish current policy from historical guidance.

Teams should distinguish defects in implementation from defects in the requirement itself; the latter may require product clarification before a test oracle can be defined.

2. Legacy Checkout Rules

Legacy guidance allowed checkout retry after a payment timeout without mandatory payment-state reconciliation. This behavior is no longer approved because it could contribute to duplicate authorization.

3. Legacy Validation

The archived version used a single generic error message for multiple checkout failures. Current standards require more actionable and stable user outcomes.

4. Historical Acceptance

Older acceptance evidence may remain useful for regression history but must not be treated as proof of current requirement coverage.
